Lab-1

Routu Venkat Sai Sampath
19BCE0238

Data

The data used for the experiments will be attached below.

	A	B	C	D	E	F	G
1	sky	airtemp	humidity	wind	water	forecast	enjoysport
2	sunny	warm	normal	strong	warm	same	yes
3	sunny	warm	high	strong	warm	same	yes
4	rainy	cold	high	strong	warm	change	no
5	sunny	warm	high	strong	cool	change	yes
6	rainy	cold	high	strong	cool	change	no
7	sunny	warm	normal	strong	cool	same	yes

	A	B	C	D	E	F
1	edition	citation	prize	size	inlibrary	buy
2	many	few	ok	small	no	no
3	one	many	not ok	big	no	yes
4	few	few	not ok	big	always	no
5	many	many	not ok	medium	no	yes
6	many	many	ok	small	no	yes
7						

Experiment 1A

Aim: Implement Find S algorithm

Procedure:

1. Get the data ready
2. Form a general hypothesis as [“Φ”…]
3. Since Φ will not be matched with any row, put the first row as the general hypothesis
4. Now compare the general hypothesis to each positive row of the dataset.
5. If any column in the hypothesis does not match with the data on the row, replace it with “?”.
6. Finally, we will obtain the general hypothesis

<u>Code, Output and Results</u>

Experiment 1B

Aim: Implement list then eliminate algorithm

Procedure:

1. Get the data ready
2. Get the hypothesis ready
3. Now run the function of item eliminate on the hypothesis
    a. First each hypothesis will get iterated over the data to find matches with same target value
    b. After matching, the hypothesis will be compared with values from the dataset.
    c. The hypothesis will be segregated into consistent and inconsistent sets.
4. The function will return the inconsistent hypothesis set first and then the consistent set.

Experiment 1C

Aim: Implement list then eliminate algorithm

Procedure:

1. Get the data ready
2. Get the hypothesis ready
3. Iterate over the values of the dataset
    a. If the target variable is positive then iterate over the specific hypothesis such that if any inconsistency is found between the values and specific hyp then change the hypothesis value to “?” on both general and specific.
    b. If the target is negative then iterate over the specific hypothesis such that if any inconsistency is found between the values and specific hyp then change the general hypothesis value to specific hypothesis. Else change the general hypothesis value to “?”.
4. Print the general hypothesis bounds and the specific hypothesis.

<u>Code, Output and Results</u>

In [1]:
```
import pandas as pd
import numpy as np

data = pd.read_csv("data_lab_1.csv")
values = np.array(data.iloc[:,0:-1])
target = np.array(data.iloc[:,-1])
```

In [2]:
```
def candidate_algorithm(values, target):
    specific_hyp = values[0].copy()
    general_hyp = [["?" for i in range(len(specific_hyp))] for i in rang
e(len(specific_hyp))]

    for i, h in enumerate(values):
        if target[i] == "yes":
            for x in range(len(specific_hyp)):
                if h[x]!= specific_hyp[x]:
